

CRM Administrator User Manual

Overview

Persona: CRM Administrator

Who you are: a tenant-level CRM administrator responsible for operational workspace configuration, user management, data hygiene, and governance within your organization.

Primary scope:

- Tenant-level configuration and administration
 - User and role management
 - Module enable/disable and workspace terminology
 - Option set maintenance and custom fields
 - Workflow and automation governance
 - Audit review and AI governance visibility
-

Seeded demo credentials

- **Email:** crm.admin@apar-elite.com
 - **Password:** AparAdmin@2026! (or the shared demo password used by your environment)
 - **Role:** CRM Admin
 - **Main landing area:** /admin
-

Key responsibilities

Admin configuration

- Manage tenant configuration from /admin.
- Access RBAC, modules, theme, terminology, custom fields, and audit logs.
- Use /admin/configuration when available to manage configuration drafts, validation, publish, and rollback.

User and role management

- Create, edit, and assign roles in **Administration → Roles & Permissions**.
- Grant the least privilege needed for each user.
- Combine roles when a user needs multiple capability sets.
- Monitor user assignments and adjust as business needs change.

Module and feature toggles

- Enable or disable modules from **Administration → Modules**.
- Disabling a module removes it from all users' navigation while preserving data.
- Typical actions:
 - Turn off unused modules like social, resellers, or training if they are not needed.

- Keep admin enabled so configuration screens remain available.

Terminology and branding

- Rename object labels from **Administration** → **Terminology**.
- Align terminology to your business vocabulary (for example, Opportunities → Deals).
- Update theme colors and logo to match tenant branding.

Option sets and dropdown maintenance

- Manage picklists for statuses, stages, sources, priorities, ticket categories, and more.
- Retire old values safely instead of deleting them.
- Keep dropdown options aligned with your sales, service, and success processes.

Custom fields and page layouts

- Add and retire custom fields from the admin configuration.
- Set custom fields inactive to hide them without losing historic data.
- Control which fields appear on forms and detail pages.

Workflow and automation governance

- Review workflows in /workflows.
- Pause or disable workflows without deleting them.
- Ensure automations are aligned with tenant business rules.
- Manage workflow activation status (draft / active / inactive).

Audit and governance

- Review audit logs for changes to:
 - roles and permissions
 - module toggles and terminology
 - configuration publish/rollback
 - AI and workflow actions
 - Use audit logs to trace authorized activity and confirm compliance.
-

Practical workflows

1. Onboard a new internal user

1. Open **Administration** → **Roles & Permissions**.
2. Create or select the appropriate role for the new hire.
3. Assign the role to the user.
4. Confirm the user signs in and sees only their permitted screens.

2. Tune tenant terminology

1. Open /admin/terminology.
2. Rename objects to match your company vocabulary.
3. Save changes.

4. Verify labels update across the tenant.

3. Clean up option sets

1. Open the relevant admin option-set page.
2. Retire outdated statuses, stages, or categories.
3. Save your changes.
4. Confirm dropdowns now show the cleaned list.

4. Manage module availability

1. Open /admin/modules.
2. Turn off any modules your organization does not use.
3. Save the changes.
4. Confirm disabled modules disappear from user navigation.

5. Review audit logs regularly

1. Visit /logs or the audit area.
 2. Filter by admin activity, RBAC, configuration, and AI.
 3. Verify changes were made by authorized users.
-

AI and agent governance

AI governance visibility

- CRM Admin can see AI configuration and usage if permissions allow.
- Review AI action history and whether AI outputs require human approval.
- Confirm AI changes are audit-logged.

Agent configurability

- The platform supports an agent registry and managed AI prompts.
- When permitted, CRM Admin can:
 - edit agent metadata
 - update descriptions
 - adjust agent prompt templates
 - configure AI-related settings through the UI

Practical AI responsibilities

- Help users enable AI assistance where it adds value.
 - Review AI-generated summaries, drafts, and recommendations.
 - Enforce human review for sensitive AI outputs.
 - Ensure AI provider settings match tenant governance.
-

Permissions and role guidance

Core admin permissions

- `admin.view`: view admin screens and dashboards.
- `admin.edit`: make tenant-level changes.
- `admin.configure`: full tenant configuration authority.
- `admin.assign`: assign roles to users.
- `admin.create`: create roles and configuration objects.
- `admin.delete`: remove roles and configuration objects.

Recommended usage

- Use `admin.view` for audit and review access.
 - Use `admin.edit` for everyday configuration changes.
 - Reserve `admin.configure` for senior CRM administrators.
 - Use `admin.assign` for user role management without giving full admin powers.
-

Best practices

- Grant the least privilege necessary for each user.
 - Use terminology settings rather than code changes.
 - Retire old option values instead of deleting them.
 - Save workflows as drafts before activating them.
 - Require a change reason whenever possible.
 - Use audit logs proactively to detect improper changes.
 - Work with your Super Admin for system-level or platform-level decisions.
-

Differences from Super Admin

- CRM Admin is tenant-scoped and focused on operational configuration.
 - Super Admin has platform-level and cross-tenant powers.
 - CRM Admin manages tenant configuration, users, roles, workflows, and audit review.
 - CRM Admin does not generally manage system-wide deployment, backups, or cross-tenant tenant administration.
-

Quick reference

- `/admin/rbac` — user and role management
 - `/admin/modules` — enable/disable modules
 - `/admin/terminology` — rename tenant labels
 - `/admin/custom-fields` — customize forms
 - `/admin/configuration` — manage configuration drafts, validation, publish, rollback
 - `/workflows` — manage automation status
 - `/ai/agents` — configure AI agents if available
 - `/logs` — review audit history
-

Notes

- This guide is aligned with the CRM platform's configuration engine and admin modules.
- Audit logging is built in for admin actions, AI actions, and workflow configuration changes.

- Always validate configuration changes in a safe environment before applying them broadly.
